(54) NOVEL BENZODIOXOL DERIVATIVE

(57)Abstract:

PROBLEM TO BE SOLVED: To provide the subject novel benzodioxol derivative that has the effect of inhibiting peroxide lipids and is useful as a medicine, cosmetic and chemical or the like.

SOLUTION: This compound is represented by the formula [R1 is H, a lower alkyl; at least one of R2 and R3 is an aromatic ring, a hetero ring (the benzofuran ring is removed) and the remaining is H], typically 5-phenyl-6-hydroxy-4-methoxy-1,3-benzodioxol. The compound of the formula, in the case of the typical compound, is prepared by halogenating 4-methoxy-6-hydroxy-1,3-benzodioxol to form 5-bromo-4-methoxy-6-hydroxy-1,3-benzodioxol, protecting the hydroxyl group, then followed by deprotection. This compound is useful as a therapeutic agent for cancers, arteriosclerosis, Parkinson's disease or the like.

DETAILED DESCRIPTION

[Detailed Description of the Invention]

[0001]

[The technical field to which industry belongs] This invention relates to a new benzo JIOKI sole derivative. It is related with the still more detailed new benzo JIOKI sole derivative which has peroxy lipid depressant action with this invention useful to an antioxidant action, medical supplies, etc.

[0002]

[Description of the Prior Art]In recent years, the expectation for an antioxidant is growing as cancer, arteriosclerosis, Parkinson's disease, diabetes mellitus, inflammation, and drugs that the relevance of phenomena, such as aging, and oxidation reaction in the living body is pointed out further, and can control an oxidation mechanism in the living body.

[0003]

[Problem to be solved by the invention]An object of this invention is to provide the benzo JIOKI sole derivative which has peroxy lipid depressor effect. Although the compound 1 shown by the following formula (2) is found out as a substance which protects hemolysis of red corpuscles from yeast (J. Am.Chem. Soc., 80, 385-389, 1958), there is no example of a report about the peroxy lipid depressor effect of a benzo JIOKI sole derivative.

[0004]

[Chemical formula 2]

[0005]

[Means for solving problem]It searches for the character of the compound obtained by this invention's finding out peroxy lipid depressor effect to a benzo JIOKI sole derivative, and compounding the intermediate field and these derivatives by organic synthesis, and the new derivative which has a high antioxidant action (peroxy lipid depressant action) is provided. This invention is a general formula (1).

[0006]

[Chemical formula 3]

The benzo JIOKI sole derivative expressed with [the arbitrary substituents as which R1 is hydrogen or a low-grade alkyl group, either [at least] R2 or R3 are an aromatic ring or heterocycle (except for a benzofuran ring) here, and the remainder is chosen from hydrogen], and its salt are provided.

[0007]

[Mode for carrying out the invention]This invention is explained in detail below. The "low-grade alkyl group" as used in this invention means the straight chain shape to eight carbon numbers, the shape of a branched chain, or annular. In this invention, "an aromatic ring or heterocycle" means the functional group permitted on Organic Chemistry Division, and they are those substituents objects, such as a phenyl group, a naphthalene group, a thiophene group, a franc group, a pyridine group, and a benzothiophene group. The salt of this invention compound means the salt permitted on medicine manufacture study, and they are sodium salt, potassium salt, calcium salt, ammonium salt, and an aluminum salt. The benzo JIOKI sole derivative of this invention is a new substance, and is useful as a chemical which has peroxy lipid depressant action and is used for drugs, cosmetics, a coal chemical product, etc. The manufacturing method is obtained under palladium catalyst existence by using the synthetic method which considers carbon-carbon bonding which used the halogenation benzo JIOKI sole object, the organic boron acid, or the organic tin reagent as a key reaction. An embodiment explains the details of the manufacture.

[0008]It is carried out by check that there is peroxy lipid depressant action in a benzo JIOKI sole derivative by this invention, and it is also checked that a new benzo JIOKI sole derivative of this invention has the outstanding peroxy lipid depressant action. Therefore, a new benzo JIOKI sole derivative of this invention is useful as a remedy of many diseases considered that a hyperoxidation reaction in the living body is involving, for example, cancer, arteriosclerosis,

Parkinson's disease, diabetes mellitus, and inflammation. A compound of this invention can be made into orally administered drugs, such as various kinds of pharmaceutical forms manufactured according to idiomatic pharmaceutical preparation technology, for example, powder medicine, a granule, a tablet, a glycolalix agent, ampule, and a capsule, hypodermic, intramuscular or an intravenous administration agent, a suppository, etc. for this purpose. Additive agents, such as the usual extender, a binding material, disintegrator, a pH regulator, and a solvent, can be used for the above-mentioned pharmaceutical preparation-ization. [0009]Although a dose to a therapy patient of a new benzo JIOKI sole derivative of this invention may be changed according to a kind, a state, etc. of a patient's age and an illness, it can usually prescribe 10-5000 mg per day for the patient in 1 to several steps to an adult.

[0010]

[Working example]An embodiment explains this invention. An embodiment is one mode of enforcement and does not limit this invention.
